Weekly Product Pulse — Groww

Review Period and Dataset

- Review period: unavailable due to missing or malformed input in the supplied batch reports.
- Confirmed review count: 0 valid review records parsed from the provided batches (the input contained the literal template string "{{ JSON.stringify($json.reviews) }}" rather than a JSON array of reviews).
- Dataset quality: No usable review text, titles, dates, or ratings were extractable. Because of this, automated theme identification, sentiment aggregation, and quote extraction could not be performed.

Key Customer Themes

- Theme identification not possible: With zero valid review records, we cannot reliably identify or quantify customer themes, sentiment, or recurring issues from the supplied data.
- Approximate counts: Not applicable — treat any theme counts as unavailable until valid review batches are provided.

Customer Evidence

- No customer quotes available: The supplied batches did not contain valid Title or Review fields, so no exact quotes, dates, or ratings could be extracted.
- What we need to proceed: a validated JSON array of review objects (each with at least Date, Rating, and either Title or Review). Example record structure was previously shared to the submitter.

Fee and Brokerage Concerns

- Official Groww links (provided; not checked live):
  - https://groww.in/pricing
  - https://groww.in/help/payments-%26-withdrawals/payments-charges/where-can-i-see-the-fees-i-ve-been-charged--43

- Verification status: No live verification of the above pages or of any specific transaction records was performed for this report (last_checked: null). Customer reports of unexpected charges should be treated as user perceptions until reconciled with transaction IDs and official settlement records.

- Neutral guidance: To resolve fee disputes or surprising charges, support should request transaction ID/date/time and settlement details from the user and reconcile against system logs and the payment/settlement screen in the app.

Recommended Actions

1. Improve ingestion validation (priority 1): Reject or flag malformed payloads (for example, un-substituted template strings) at ingestion and return clear, actionable errors to the sender so that analysts receive valid JSON arrays.

2. Enforce a minimal review schema (priority 2): Require each review object to include at minimum one of {Title, Review} plus Date in ISO 8601 format and a numeric Rating. Validate incoming batches before analysis to enable automated theme extraction and quote capture.

3. Add in-app transaction fee transparency (priority 3): Display an expandable per-transaction fee breakdown with links to the official pricing and help pages to reduce user confusion and lower support volume.

Notes on next steps

- If you can re-submit the actual JSON array of reviews (not a template string), I will re-run the analysis, extract up to three exact quotes with dates and ratings, compute theme counts and percentages, update the Weekly Product Pulse doc, and prepare the email for human approval and send/draft per configuration.
